

i-mirror desk

Would you like to know which glasses your customers have tried in your store?

Trying on glasses by your customers are detected simultaneously by I- mirror.

Thanks to the high-performance antennas of the RFID tags on the glasses and the sensitive proximity-perception technology, the products your customers try are instantly detected.

The detected tags are concurrently saved to the cloud and the data of all branches can be stored safely in a single center and easily tracked.

Disclaimer: Our company, reserves the right to change its products and services at any time without notice. Our recommendations are based on our best knowledge and experience. As the products are used beyond our control we cannot be held liable for any damages caused when using the product. Use extra care in handling the product and observe standard storage and handling practices to minimize ESD (electro static discharge). This technical specification replaces all earlier ones.

Why i-mirror desk ?

Which eyewear models are tried on?

When it tried on?

Which of the tried on glasses are sold or not?

How many people are entered the store and how many glasses are being tried?

i-mirror desk

Replacing the classic mirrors used in stores, i-mirror will give you a different customer experience with RFID integrated solutions.

We offer you detailed analysis with our system that is integrated with your sales and marketing data.

"We are where you look"

Our mirrors, upgraded with RFID technology, record all your customers' eyewear attempts. It prepares detailed product reports based on model, time and store.
